March 2002

INTRODUCTION, TECHNICAL NOTES, AND DEFINITIONS

Introduction

The Bureau of Epidemiology is very pleased to be of service to programs across Health Services, at both the state and local levels, and to our many community partners. We take our obligation to provide consultation and technical assistance for science-based decision-making quite seriously. Our goal is to assist in finding local solutions to local problems.

The format of this report is updated periodically to incorporate suggestions expressed by end-users of our data. We want to continuously improve upon the content, presentation, and overall usefulness of all information we disseminate. As a result, the Maternal and Child Health (MCH) Epidemiology and Special Projects staff strongly encourages continued input from all of our data users. If you have thoughts or suggestions, please forward them to:

Herman E. Core, MSHP, RRT, CHES
Division Director
Division of Maternal and Child Health (MCH) Epidemiology and Special Projects
Bureau of Epidemiology
1800 St. Julian Place, Suite 406
Columbia, SC 29204

Fax: 803-545-4921
Email: *corehe@dhec.state.sc.us*

In Section I of this report, entitled “Graphs with Interpretive Trend Analysis of State Performance on Select MCH Indicators”, please note the following: a) a graph visually demonstrates the state’s performance on each indicator, b) a narrative provides a brief interpretation of the trends, and finally, c) a data table accompanies each graph to further assist the reader. Data for the “Other” race group is not graphed in most cases due to very small numbers, which make the rates unreliable. However, the rates and proportions for “Other” race group are reported in Section II but must be used with caution due to their unreliability. This is relevant particularly at the county level. South Carolina has a growing Hispanic population. As a result, a graph has been added to Section I to reflect this growing trend. Infant Mortality is presented in both one-year and three-year rates. Three-year rates are calculated by county, as the numbers are too small to calculate single year rates. The single-year rates were calculated only for the state as a whole for the purpose of comparison to US rates and to Year 2000 goals.

In Section II of this report, entitled “Data Tables: Rates, Proportions, and Actual (Raw) Count Data for Select MCH Indicators”, data tables contain information by district, by county, and by race group. Please note that rates can vary quite a bit from year-to-year, particularly at the county level. This could be due to small numbers and random variation. In some cases, rates and proportions are reported as a three-year average to gain a larger set of events to reduce the likelihood of wide variations and form a more stable trend. Finally, in this section you will note that raw numbers or actual count data are provided in addition to rates and proportions to further assist our data users.

Section III, entitled “Health Services Data Provided by MCH Programs” contains data from MCH

Programs, including Family Planning, Prenatal, Child Health, and CRS data.

Technical Notes

International Classification of Diseases (ICD) Classifications

In order that disease classifications may be consistent with advances in medical science and changes in diagnostic practice, any system for categorizing causes of death must periodically be revised. Major revisions in the International Classification of Diseases (ICD) by which causes of death are classified, occur approximately every ten years, and each decennial revision of the ICD has produced some break in comparability of cause of death statistics. In South Carolina, the Sixth Revision of the ICD was used from 1949-1957; the Seventh Revision for 1958-1968; the Eighth 1969-1978; the Ninth 1979-1998; and the Tenth Revision went into effect in 1999.

ICD-10 differs from previous revision of ICD-9 in a number of respects: 1) ICD-10 is far more detailed than ICD-9, about 8,000 categories compared with 4,000 categories. The expansion was mainly to provide more clinical detail for morbidity applications; 2) ICD-10 uses 4-digit alphanumeric codes compared with 4-digit numeric codes in ICD-9; 3) three additional chapters have been added and some chapters rearranged. Cause-of-death titles have been changed, and conditions have been regrouped; and 4) some coding rules have been changed. ICD-10 is also published in three volumes compared with two volumes in ICD-9.

The introduction of a new revision of the ICD can create major discontinuities in trend analysis for cause-specific mortality data. The extent of the discontinuity is measured using a "comparability ratio", which results from double-coding a large sample of the national mortality file. The file is coded once by the old revision, and again by the new revision, and results of the comparison are expressed as a ratio of deaths for a given cause of death by the later revision divided by the number of that cause of death coded and classified by the earlier revision (# deaths by ICD-10 code/# deaths by ICD-9 code).

A preliminary comparability study has been prepared for ICD-10 using deaths occurring in 1996. The comparability study shows ICD-10 tabulation categories compared with ICD-9 tabulation categories, and the approximate quantitative relationship between similar categories of ICD-10 compared with ICD-9.

Definitions of Terms

The following terms are used throughout this book. General explanations of terms are found here. Detailed formulas used to determine the rates and proportions are found in the Appendices.

<i>Fetal Death</i>	Death to a fetus weighing at least 350 grams or completing 20 or more weeks gestation.
<i>Fetal Mortality</i>	A ratio of fetal deaths/(live births + fetal deaths) expressed as deaths per 1000 live births + fetal deaths.

<i>Hispanicity</i>	This is a separate category from race. Classification of Hispanic or Non-Hispanic is by self-report on the birth certificate. This data is the response to the question “Mother of Hispanic origin?” Hispanic origin may include Mexican, Cuban, Puerto Rican, or of Spanish origin.
<i>Infant Death</i>	Death occurring 365 days or less after birth.
<i>Infant Mortality</i>	A ratio of number of infant deaths divided by number of infant live births, expressed as deaths per 1000 live births.
<i>Kessner Index</i>	An index for expressing adequacy of prenatal care. It is determined by the sum of (1) live birth indicating on prenatal care or prenatal care starting \geq 28 weeks and (2) live birth records showing little or no prenatal visits minus (3) all records missing month or year for LMP and all records with gestational age <18 weeks or >48 weeks. See Appendix A for detailed explanation of the criteria for the index.
<i>Level III Hospital</i>	Hospital with a Neonatal Intensive Care Unit licensed to care for very low birthweight infants. Level III Hospitals provide all aspects of perinatal care, including intensive care and continuously available subspecialty consultation. Level III Perinatal Units must have at least 1500 deliveries annually or at least 125 admissions annually weighing less than 1500 grams, requiring ventilatory support, or requiring surgery.
<i>Low Birth Weight (LBW)</i>	Infants weighing <2500 grams at birth. Proportion of LBW infants is determined by number of LBW infants / number of live births expressed as percent of live births.
<i>Neonatal Death</i>	Deaths to infants ages 0-28 days.
<i>Postneonatal Death</i>	Deaths to infants aged 29 to 365 days.
<i>Race</i>	Determined on the birth certificate by self-report and based on race of Mother. Race may be “Black,” White,” or “Other.” “Other” includes Asian, Native American, and Pacific Islander.
<i>Teen Pregnancy Rate</i>	A ratio of number of pregnancies (including abortions both spontaneous and induced, fetal deaths, and live births) divided by number of females ages 15-17 years, expressed as pregnancies per 1000 females ages 15-17.
<i>Very Low Birth Weight (VLBW)</i>	Infants weighing <1500 grams at birth.

ACKNOWLEDGMENTS

Several units within the agency contributed data and/or assisted with the production of this annual report. We are very grateful for their assistance, contributions, and patience.

SECTION I

Graphs With Interpretive Trend Analysis of Performance on Select MCH Indicators

Annual Live Births

South Carolina (1990-2000)

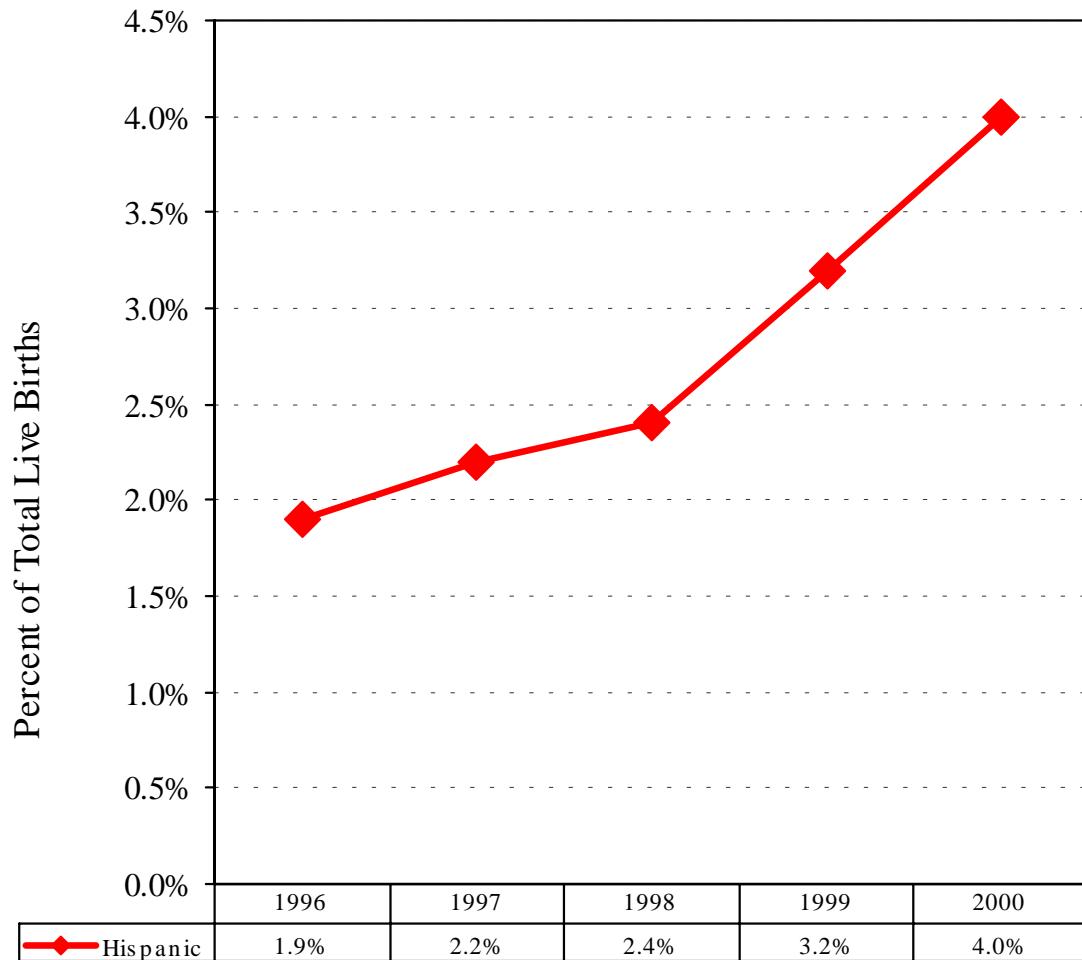

- There has been an overall decreasing trend in the number of live births to South Carolinians from 1990 to 2000. There were 58,461 live births in 1990 and 55,964 in 2000, representing a 4.2% drop during this period. However, live births began to increase in 1996 and the state has seen a 9.5% increase over the last five years.
- When reviewing live births by race/ethnicity, a decreasing trend is observed among all subgroups until 1996. White live births climbed by 10.4% from a low of 31,830 in 1995 up to 35,146 in 2000. Similarly, black live births increased by 9.3% from a low of 17,994 in 1996 to 19,681 in 2000. White live births have accounted for at least 60 percent of live births in SC each year, since 1990.

Annual Live Births to Hispanic Moms

South Carolina 1996-2000

- When reviewing South Carolina live births to Hispanic moms, a clear increasing trend is observed since 1996.
- Live births to Hispanic moms increased from 1.9% of total live births in 1996 to 4.0% in 2000. This represents a 110% increase over the past 5 years.

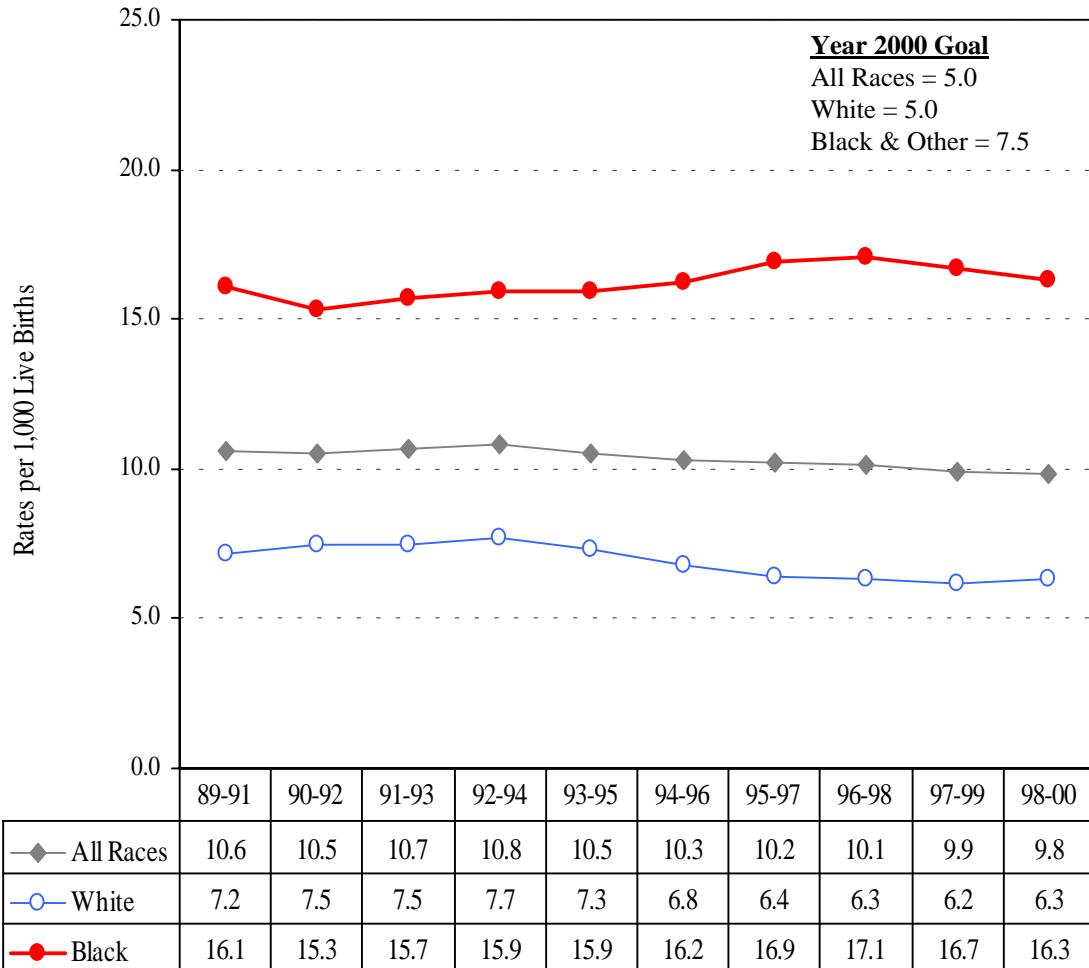

Data Source:, OPHSIS SC DHEC

Prepared by: Division of MCH Epidemiology & Special Projects

Three-Year Fetal Mortality Rates

South Carolina (1989-91 to 1998-00)

- ▶ Fetal deaths in SC, overall, have decreased slightly from 10.6 deaths per 1,000 live births in 1989-91 to 9.8 in 1998-00.
- ▶ When reviewing fetal deaths by population subgroups, a different picture emerges. White fetal death rates have declined from 7.2 deaths in 1989-91 to 6.3 in 1998-00. This decline has been consistent and similar to the decreasing pattern for the state. Fetal death rates among Black infants have increased slightly from 16.1 in 1989-91 to 16.3 in 1998-00.
- ▶ The Black/White disparity increased from 2.2 in 1989-91 to 2.6 in 1998-00.
- ▶ Fetal death rates in SC have not met the year 2000 goal for either all races, White, or Black race groups.

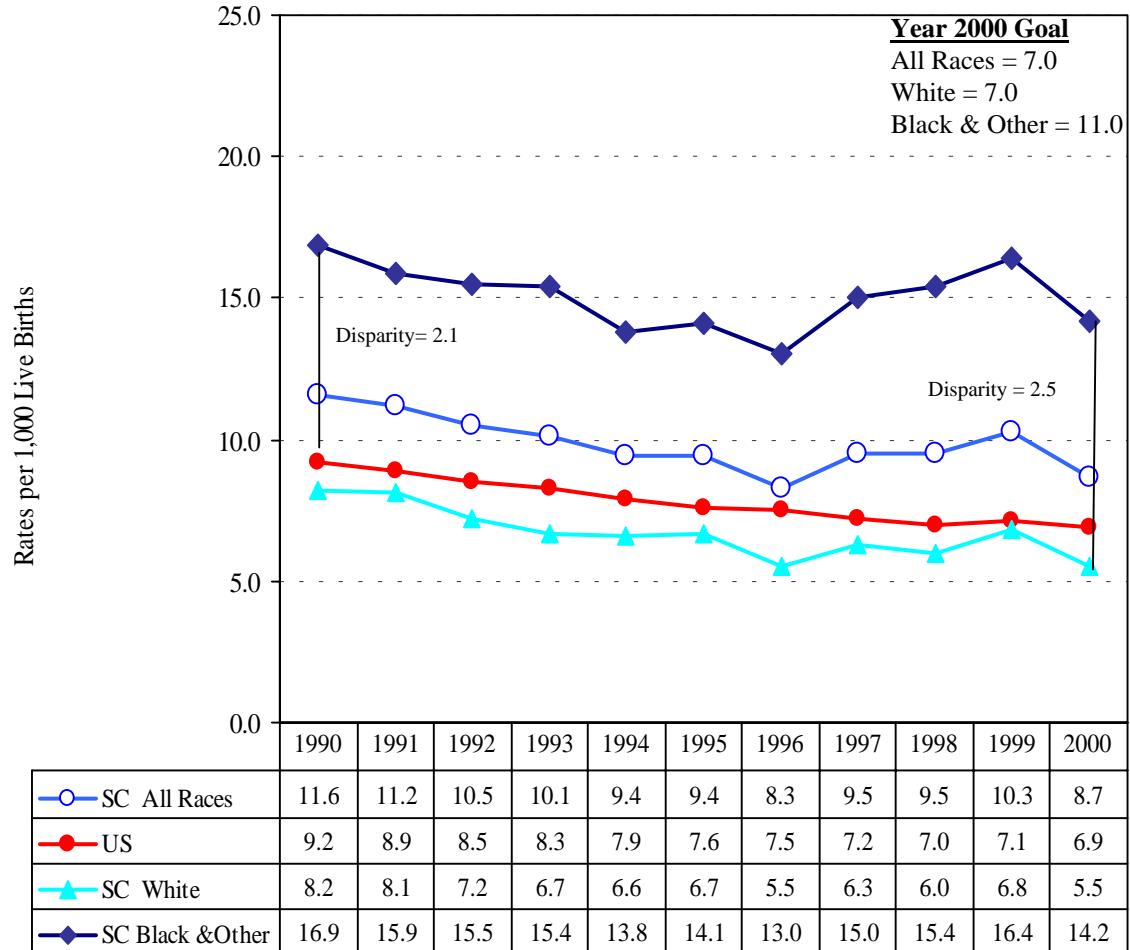

Data Source: OPHSIS, SCDHEC

Prepared by: Division of MCH Epidemiology & Special Projects

Single-Year Infant Mortality Rates

US Rates and SC Rates by Race (1990-2000)

- The single-year infant mortality rate in SC among all races has declined from 11.6 per 1,000 live births in 1990 to 8.7 in 2000. The longstanding declining trend in SC turned in 1997, after declining at a faster rate than the U.S. for several years. Consequently, SC did not reach the US Healthy People Year 2000 objective of 7.0 infant deaths per 1,000 live births among all races. However, the current year rate of 8.7 represents a new low since 1996 and a vast improvement over the prior year (1999) rate of 10.3.
- While the SC overall infant mortality rate has consistently been higher than the national rate for the past 10 years, the White rate has consistently been lower. On the other hand, the SC Black infant mortality rate has consistently been higher than the US rate over the last 10 years.
- The SC Black/White Disparity has widened slightly over the past 10 years. The lowest disparity (ratio) of 2.1 in 1990, has widened to a high 2.5 in the current year.

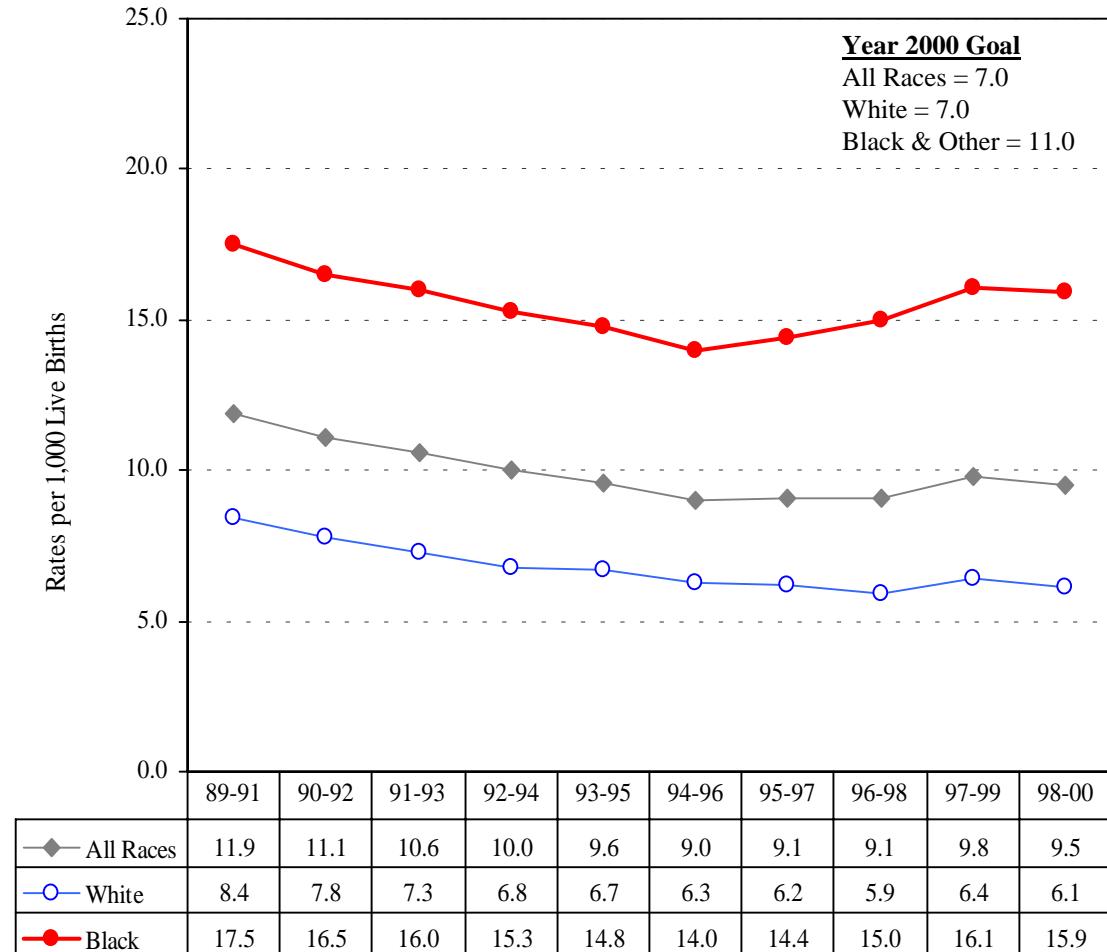

Data Source: OPHSIS, SCDHEC

Prepared by: Division of MCH Epidemiology & Special Projects

Three-Year Infant Mortality Rates

South Carolina (1989-91 to 1998-00)

- Infant deaths in SC among all races have seen a decline from a rate of 11.9 in 1989-91 to 9.5 in 1998-00. The long standing declining trend began to increase in 1995-97. Thus, SC did not reach the US Healthy People Year 2000 objective of 7.0 infant deaths per 1,000 live births among all races.
- Infant deaths, when reviewed by race/ethnicity reveal differences. The death rate for white infants declined from 8.4 deaths per 1,000 live births in 1989-91 to 6.1 in 1998-00. Death rates for black infants declined from 17.5 in 1989-91 to 15.9 in 1998-00.
- The Black/White disparity has increased from a ratio of 2.1 in 1989-91 to 2.6 in the current period (1998-00).
- SC Whites have reached and exceeded the race specific Healthy People Year 2000 objective of 7.0 infant deaths per 1,000 live births. However, SC did not reach the Year 2000 objective of 11.0 deaths for Black and Others.

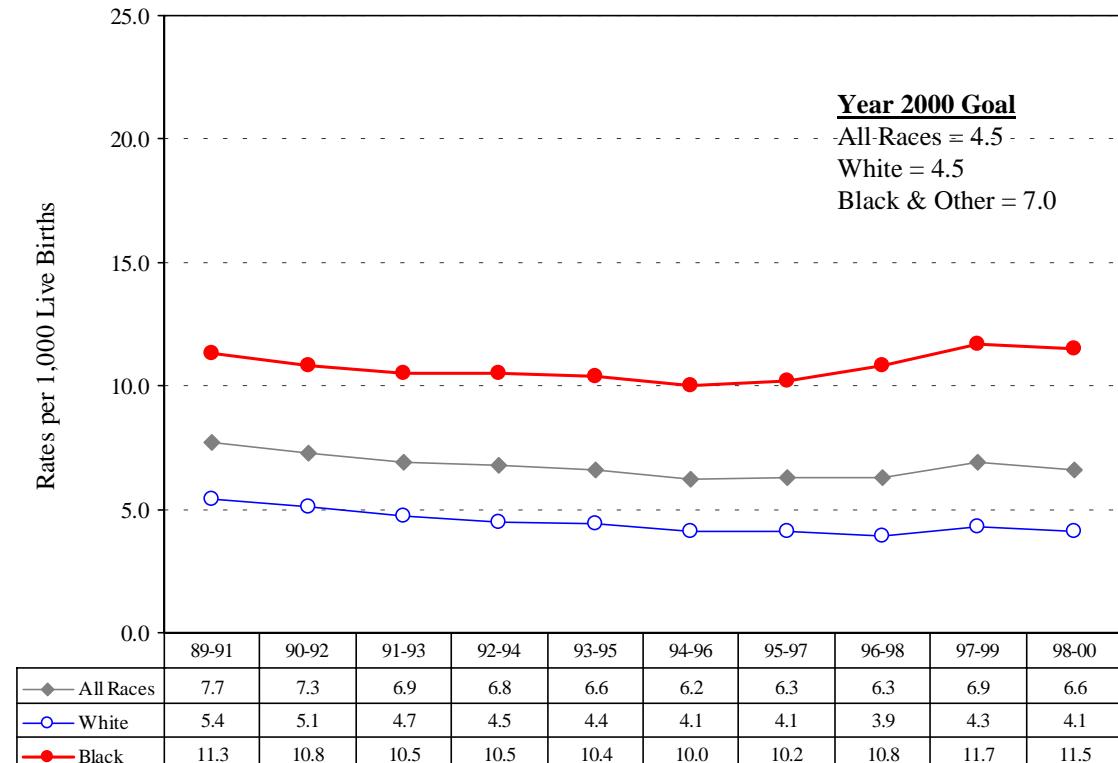

Data Source: OPHSIS, SCDHEC

Prepared by: Division of MCH Epidemiology & Special Projects

Three Year Neonatal Mortality Rates

South Carolina (1989-91 to 1998-00)

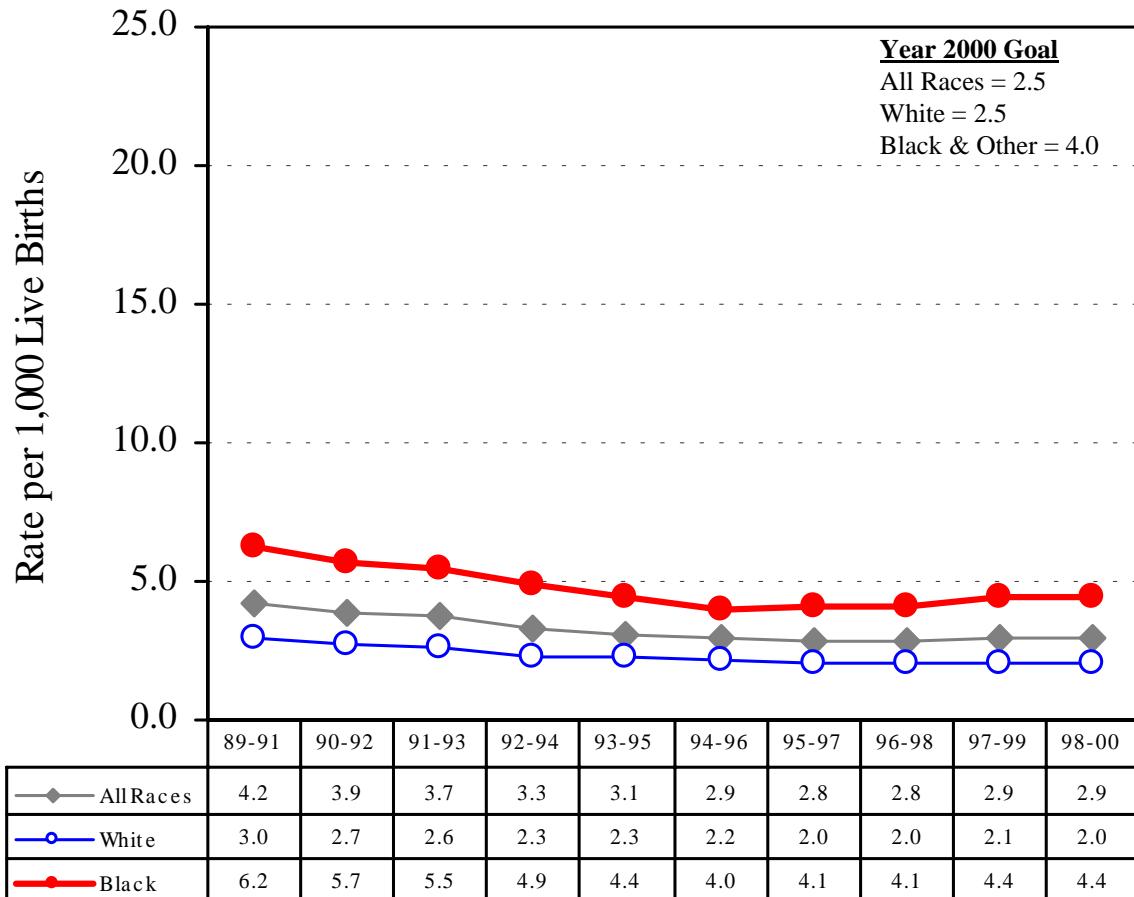

- ▶ Neonatal deaths among South Carolinians have decreased by 14.3% from 7.7 per 1,000 in 1989-91 to 6.6 in 1998-00.
- ▶ Neonatal deaths among Black infants have increased from 11.3 deaths per 1,000 live births in 1989-91 to 11.5 in 1998-00. The death rate for Whites has dropped from 5.4 in 1989-91 to 4.1 in 1998-00.
- ▶ The Black/White disparity increased from 2.1 in 1989-91 to 2.8 in 1998-00.
- ▶ The Healthy People Year 2000 goal was met for Whites but not for Black and Others.

Three-Year Postneonatal Mortality Rates

South Carolina (1989-91 to 1998-00)

- Postneonatal deaths in SC decreased slightly from 1989-91 to 1998-00. In 1989-91, the death rate was 4.2 deaths per 1,000 live births and in 1998-00 the death rate dropped to 2.9, a 31% decline.
- In 1989-91, the death rate for Whites was 3.0 deaths per 1,000 live births and in 1998-00 the rate was 2.0, a 30% decline. The 1989-91 death rate for Black infants was 6.2 and dropped to 4.4 in 1998-00.
- The Black/White Disparity increased from 2.1 to 2.2 in the past 10 years.
- The Year 2000 goal for postneonatal mortality was met for white infants. The Year 2000 goal was 90% met for black infants and 85% met for all races.

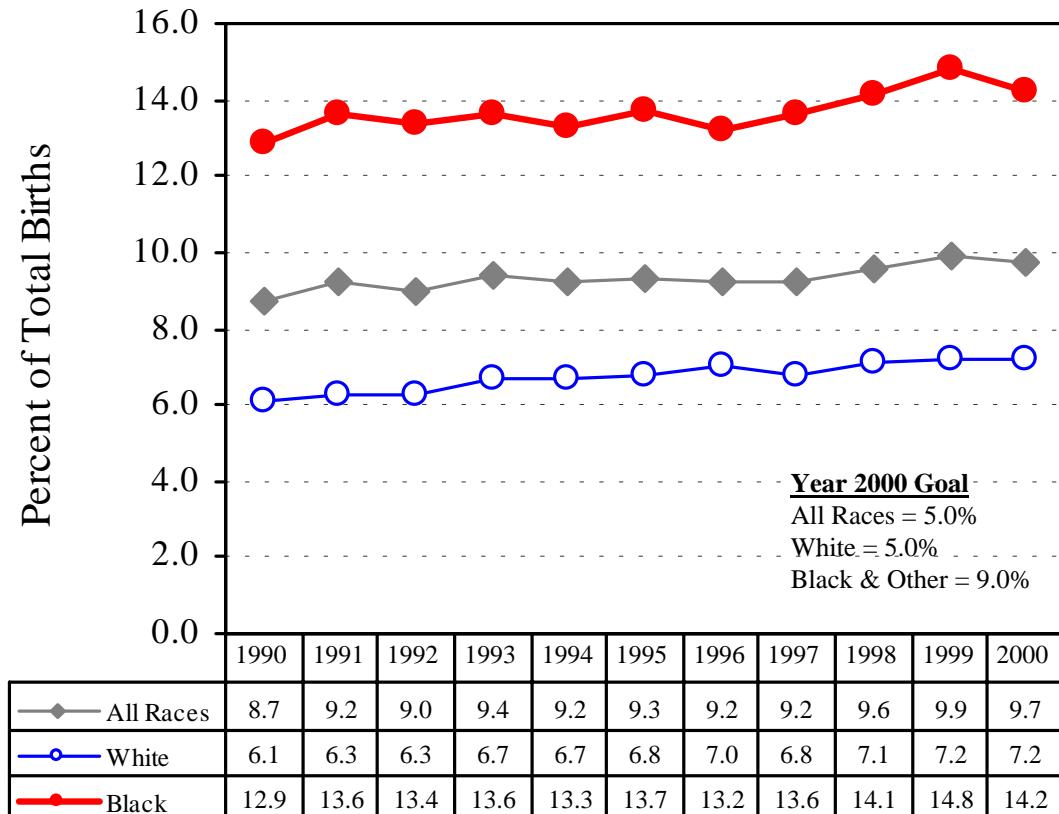

Data Source: OPHSIS, SCDHEC

Prepared by: Division of MCH Epidemiology & Special Projects

Percent Low Birth Weight

South Carolina (1990-2000)

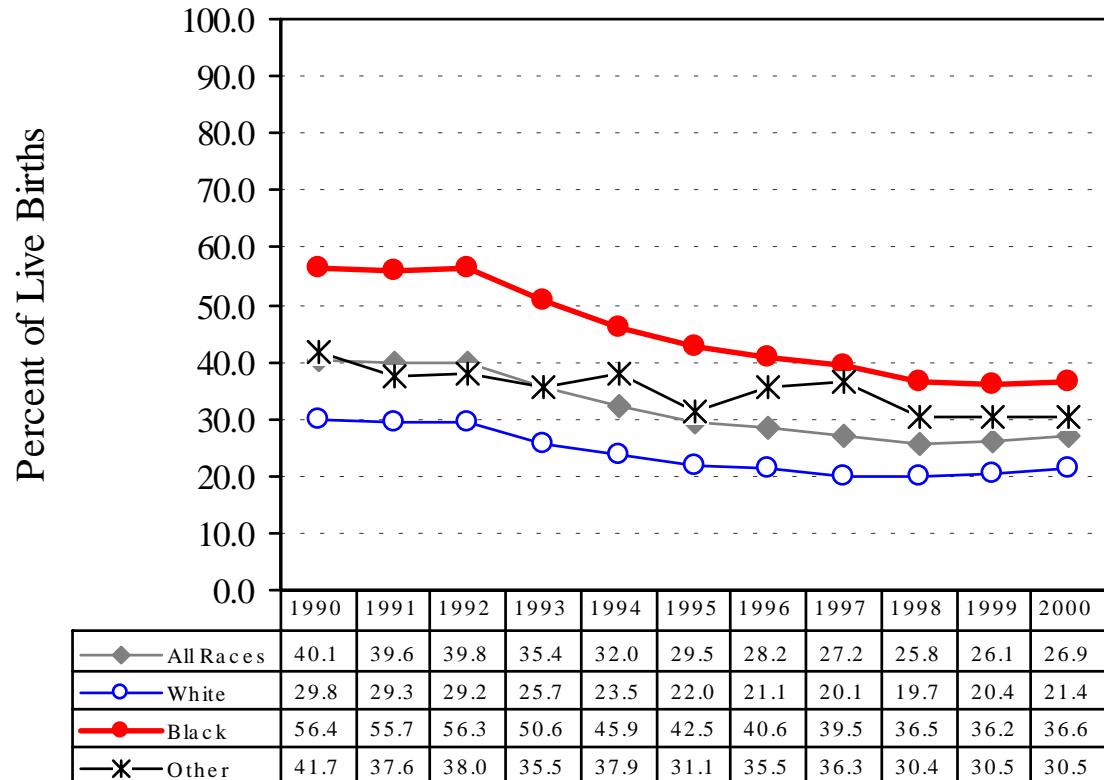

- The percent of low birth weight births, in SC, has increased from 8.7% of all live births in 1990 to 9.9% in 1999, representing a 13% increase, then decreased to 9.7 in 2000.
- Low birth weight births increased among Whites from 6.1% in 1990 to 7.2% in 2000, a 18% increase. Low birth weight births among Blacks increased from 12.9% in 1990 to 13.7% in 1995. The overall trend leading to this 4.6% increase has been inconsistent. The trend for low birth weight births among Blacks reveal a consistent increase from 13.2 in 1996 to 14.8 in 1999, then decreased to 14.2 in 2000.
- Black/White Disparities remained fairly consistent, ranging from 2.0 to 2.2, but decreased 4% in past 10 years.
- The Year 2000 goal for percent LBW was not met either for all races, or for white or black race groups.

Percent of Women With Less Than Adequate Prenatal Care (Kessner Index)

South Carolina (1990-2000)

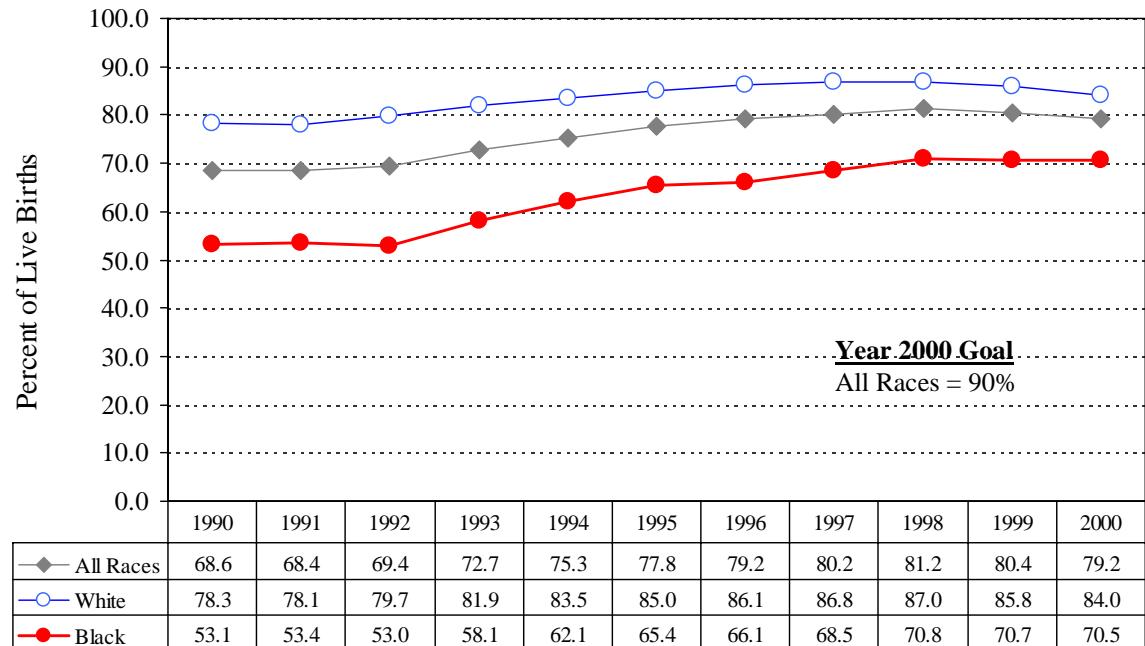

- ▶ SC has seen improvement in women receiving less than adequate prenatal care since 1990. The rate in 1990 was 40.1 compared to 26.9 in 2000. This represents a 33% change in 10 years.
- ▶ Improvement has been observed in every racial/ethnic subgroup. In 1990, 29.8% of the state's White pregnant women received less than adequate prenatal care compared to 21.4% in 2000, a 28% increase. In 1990, 56.4% of Black pregnant women had less than adequate prenatal care compared to 36.6% in 2000, a 35% decrease.
- ▶ Improvement is also observed in the Other race group from 41.7% in 1990 to 30.5% in 2000, a 27% change.
- ▶ The racial/ethnic disparity between White and Black women has been improving consistently since 1992.

Percent of Live Births Receiving Prenatal Care in First Trimester of Pregnancy

South Carolina (1990-2000)

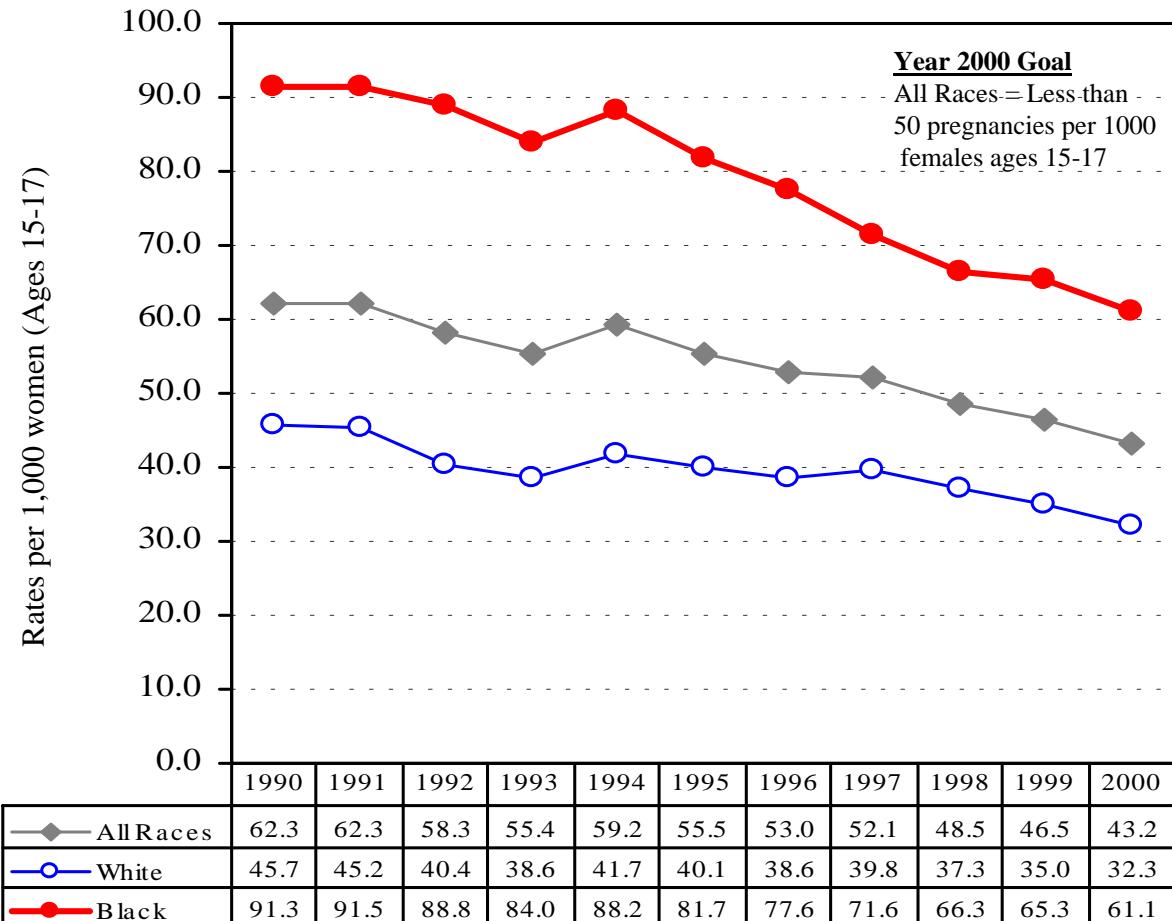

- Improvement in first trimester entry into prenatal care in SC has been longstanding and consistent. The rate in 1990 for all races was 68.6% of live births with known prenatal care status and climbed to 79.2% in 2000.
- During 1990 to 2000, improvement can be seen among all racial/ethnic subgroups. In 1990, 78.3% of White live births received prenatal care in the first trimester compared to 84% in 2000; this represents an 11.1% increase. The 1990 rate for Black was 53.1% and this increased to 70.5% in 2000 for a 34% increase.
- The Black/White disparity (ratio) has been improving since 1992. The HP 2000 goal of 90% for All Races was reached.

Teenage Pregnancy Rates (Ages 15-17)

South Carolina (1990-2000)

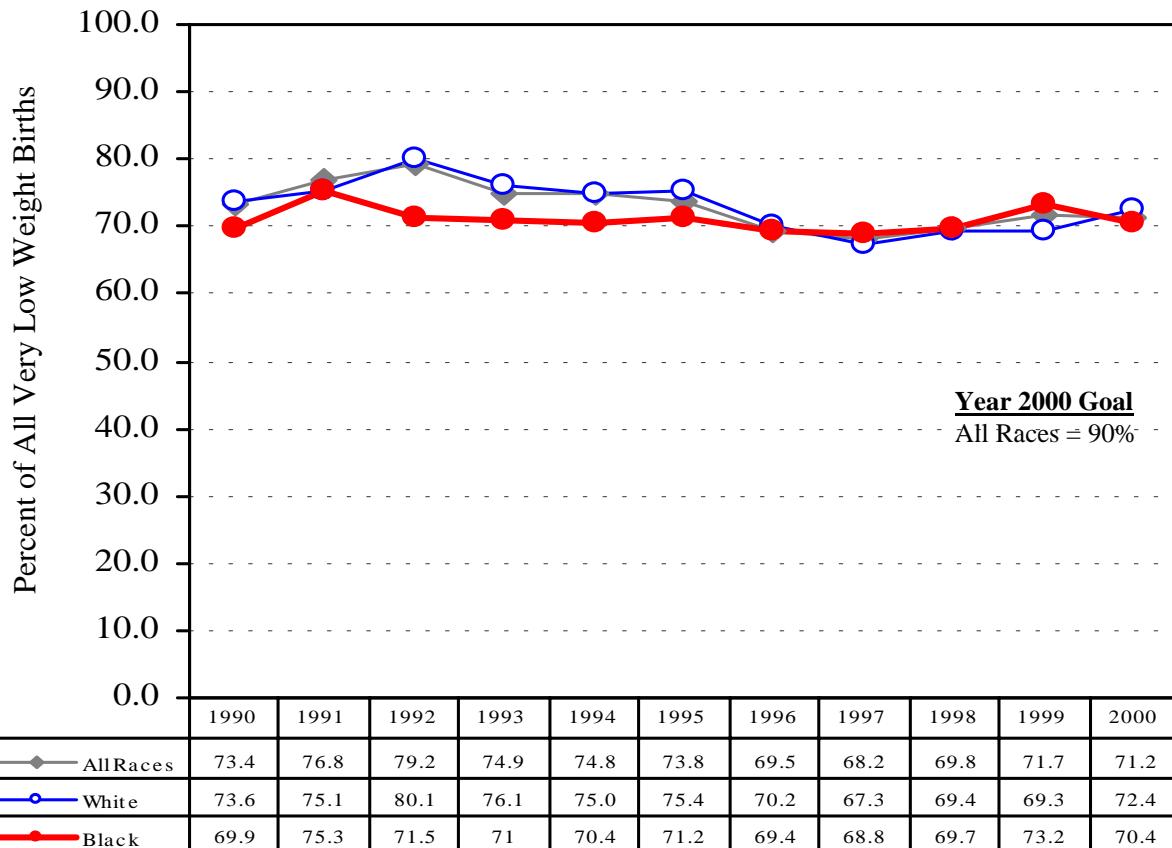

- Teenage pregnancies among 15-17 year old South Carolinian females have decreased from a rate of 62.3 per 1,000 in 1990 to 43.2 in 2000; a 30.6% decline.
- This success is also seen when viewing teen pregnancy by racial/ethnic subgroups. The rate for White 15-17 year old teens was 45.7 in 1990 and 32.3 in 2000, representing a 29% decline. The rate for Blacks was 91.3 in 1990 and 61.1 in 2000, representing a 33%.
- The Black/White disparity has not changed much in the past 10 years; the gap has decreased by 6% between 1990 and 2000.
- The Year 2000 goal was met for both the All Race group and Whites but not for Blacks.

Percent of Very Low Birth Weight Births Occurring in Level III Hospitals

South Carolina (1990-2000)

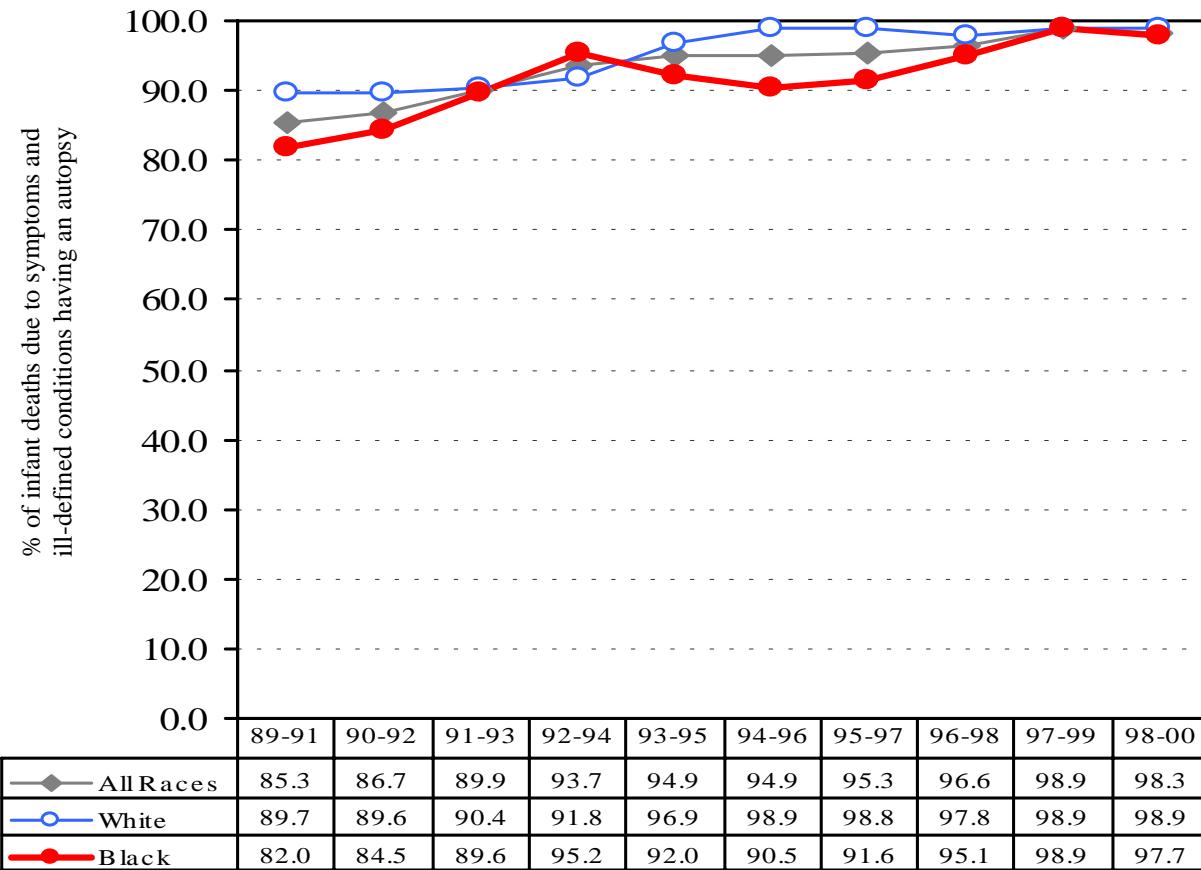

- There has been little change in the occurrence of very low birth weight births (VLBW) in Level III hospitals from 1990 to 2000. In 1990, 73.4% of the state's VLWBs occurred in a Level III hospital compared to 71.2% in 2000.
- Very little variation is observed when reviewing VLBWs in Level III hospitals by racial/ethnic subgroups. In 1990, 73.6% of White VLWBs occurred in a Level III hospital compared to 72.4% in 2000. Among Black VLWBs, in 1990, a total of 73.2% occurred in a Level III hospital compared to 72.7% in 1995. Blacks have remained fairly stable since 1992 with only a slight increase in 1999.
- The Healthy People Year 2000 goal for VLBWs born in a Level III hospital was not met for any race group.

Percent of Infant Deaths Due to Symptoms and Ill-Defined Conditions Having an Autopsy

South Carolina (1989-91 to 1998-00)

- The overall number of infant deaths due to symptoms and ill-defined conditions having an autopsy has increased from 85.3% in 1989-91 to 98.3% in 1998-00, representing a 15.2% increase.
- When reviewed by racial/ethnic subgroups, a similar improving trend is observed for both Whites and Black and Others. Whites increased from 89.7% in 1989-91 to 98.9% in 1998-00, representing a 10% increase. Black and Others saw an increase from 82.0% in 1989-91 to 92.0% in 1993-95, representing a 12% increase.
- In 1998-00 there is no longer a racial/ethnic disparity involving any of the population subgroups.

AIMv2: Accelerated Immunization Module report generated from SCDHEC PATS computer system.

*Columns all counted as patients with delinquent immunization.

**CCHD includes data from the Downtown and Ravenel Clinics.

**CCHD includes data from James Island effective March 2000.

***Summerville data includes Ridgeville Clinic.

**** Anderson did not report for this month per their DHD order.

Those counties showing zeros and ERR in all columns are in transition or report not received by due date for AIVv2.

	36 or more	and 9 or more
Inadequate ^b	14-21 ^c	and 0 or not stated
	22-29	and 1 or less or not stated
	30-31	and 2 or less or not stated
	32-33	and 3 or less or not stated
	34 or more	and 4 or less or not stated
Intermediate	All combinations other than specified above	

- ^a In addition to the specified number of visits indicated for adequate care, the interval to the first prenatal visit has to be 13 weeks or less (first trimester).
- ^b In addition to the specified number of visits indicated for inadequate care, all Women who started their prenatal care during the third trimester (28 weeks or later) are considered inadequate.
- ^c For this gestation group, care is considered inadequate if the time of the first visit is not stated.
- ^d When month and year are specified but day is missing, input 15 for day.

Adequacy categories are in accord with recommendations of American College of Obstetrics and Gynecology and the World Health Organization.

Appendix B

Formulas Used to Calculate Indicators

Fetal Mortality =	$\frac{\text{number of deaths to fetuses weighing at least 350 grams}}{\text{In weight or completing 20 or more weeks gestation}}$	X 1000
	number of live births	
Neonatal Mortality =	$\frac{\text{number of deaths to infants ages 0-28 days}}{\text{number of live births}}$	X1000
Postneonatal Mortality =	$\frac{\text{number of deaths to infants aged 28 to 364 days}}{\text{number of live births}}$	X1000
Infant Mortality =	$\frac{\text{number of deaths to infants ages 0-364 days}}{\text{number of live births}}$	X1000
Low Weight births =	$\frac{\text{number of infants weighing <2500 grams at birth}}{\text{number of live births}}$	X1000
Very Low Weight Births =	$\frac{\text{number of infants weighing <1500 grams at birth}}{\text{number of live births}}$	X1000
Very Low Weight Births Occurring in a Level III Hospital¹ =		
	Number of very low birth weight(VLBW) <u>Infants born in a level III hospital</u>	
	$\frac{\text{number of VLBW live births}}{\text{number of VLBW live births}}$	X1000
Women with Less than Adequate Prenatal Care =		
	Number of women with inadequate or <u>Intermediate prenatal care (Kessner Index²)</u>	
	$\frac{\text{number of live births}}{\text{number of live births}}$	X1000

¹ A Level III Hospital is one with a Neonatal Intensive Care Unit

² Kessner Index uses all out-of-state residents events. It is the sum of (1) live birth indicating on prenatal care or prenatal care starting ≥ 28 weeks and (2) live birth records showing little or no prenatal visits minus (3) all records missing month or year for LMP and all records with gestational age <18 weeks or >48 weeks.
